

Final writing portion

For this project, I wanted to create more glitch art and see what kind of changes to an image I could make with notepad++ and audacity. This led me to wanting to create images based on the concept of trying to remember a dream you had. I chose this concept because I thought it was interesting when I was brainstorming on what I wanted to make for this project. In addition to that, I thought that it would be interesting to mix dreams and glitch art. Dreams and Glitches seemed like an interesting mix because it reminded me of how both can seem unpredictable and fragmented. I was curious about what the result would look like when using the programs I planned to use to mix glitches and dreams together.

For all four images, I wanted them to have a distorted dream-like look to them. Most dreams I had tend to be strange and surreal. I tried replicating that into the images I created by taking images you might find in real life and adding in elements that would not make sense in the real world like a flower with an eye in it. All of the glitches are shown through the blocks of color that go across the image. The shift in certain parts of the images are also caused by the glitches. I wanted to use glitches to represent the distorted memory of the dream, so the amount of distortion you see on each image shows how much of it could be remembered. Also, there are some parts of the image that I wanted to stick out more and have a little more clarity than the rest of the image. This is to show that there might be some details you remember about a dream. My intention is to create images that would seem like something that could happen in a dream. I also wanted the images to come off as confusing when looking at them because of how the images look. There is a very loose story being told through these images and it is based on a dream I had when I was younger. The story itself does not matter too much, but I wanted to have something that loosely connected all the scenes together. The images are out of order and I did that intentionally because I wanted to mimic how I would remember parts of a dream in a random order. I used my childhood dream to build the images because it helped me figure out how I wanted the images to be built and I wanted to loosely recreate them.

The programs I used to create the four images are photoshop, notepad++, and audacity. Photoshop was used because I wanted to create my own scene using a mix of images I found online. I thought that creating my own scenes would be better than using a singular image I could find online. All the images I used were found online and I kept the images mostly unaltered. Once I felt that the initial scene seemed perfect, I edited the images through notepad++ and audacity. These two apps allowed me to glitch the images. A big part of the process while using notepad++ and audacity was trial and error. There were many points that I would change something in the image and undo the change because it would either make a change I did not like or break the entire image. After I am satisfied with results, I would either edit them in photoshop or do more glitches with Audacity. The glitches I got from audacity were minimal and sometimes I could not tell if something changed. Because of that, I only made some small changes through audacity. I decided to edit the glitched image in photoshop because I wanted to add filters and additional glitch effects. I also wanted some parts of the images to stick out more and make them clearer than the rest of the image. Overall, I thought the process was fun because seeing how the image changes and shifts when I mess around them in programs I used.
